CLOUDFLARE OS FOR SCHOOLS

Agents, gadgets and guardrails for K-12, in the district's own account.

EducateOS turns the open-source Cloudflare OS into a learning environment. Classes get agents that know the course, teachers and students build small sandboxed apps, and every data read and write passes through a policy the district sets. It is open source (Apache-2.0) and in development.

What it is

Agents for each class, limited to what policy allows.

Gadgets: small apps built by asking, each in its own sandbox.

Gatekeepers: connectors where reads are recorded and writes wait for a person.

LMS-lite: courses, quizzes, gradebook and families, K-12, with 12 open courses.

Who owns it

Installed in the **district's Cloudflare account**, under its credentials.

educateos.io offers an optional guided install, updates and a marketplace. It never sits in the data path or gates features.

Signed releases, verified offline against keys the district pins.

Student privacy

Built for FERPA and COPPA. Education records stay in the district's account. Gmacko Ventures LLC never receives, stores or processes them, outside support a district requests in writing.

No advertising, no sale of data, and automated profiling prohibited.

No certification or third-party audit is claimed.

CAPABILITY	DETAIL	STATUS
Platform and safety		
Agent chat, gadgets and sandboxes	Each agent and gadget starts with access to nothing.	Available in Cloudflare OS
Gatekeepers and the approval queue	Google Workspace, MCP servers and portal, Context Library, Web Search, GitHub and more.	Available in Cloudflare OS
District app: classes, gradebook, families	Runs the live demo district, deployed from source. Not yet from a signed release or the installer.	In development
Default-deny policy and teacher approvals	Grades that AI drafts stay drafts until a teacher approves them.	In development
Hall Monitor screening and AI spend caps	Guard deployed. Grade-band tutors: pilot preview, synthetic students only.	In development
Integrations (no 1EdTech certification is claimed)		
LTI 1.3 and LTI Advantage (Deep Linking, AGS, NRPS)	Passed live runs against current Canvas and Moodle 4.5.	Supported
Canvas	Developer key and four placements, passed against a current Canvas.	Supported
Google Classroom	Coursework and an approved grade run live on one course.	Unit-tested
OneRoster 1.2 (CSV and REST)	Preview, quarantine, all-or-nothing apply, deactivation instead of deletion.	Unit-tested
Clever sign-in through Cloudflare Access	Running against Clever's sandbox.	Validating against live sandbox
Clever roster sync and large-removal holds	End to end against a fake of Clever's Data API. No live roster import yet.	Harness-tested
ClassLink (OneRoster REST and sign-in)	Built against our own fakes. No ClassLink account to test against yet.	Implemented (fakes only)
District MCP server for outside AI clients	Tested with the official MCP client. Off in production.	Harness-tested

Good fits for a pilot

Districts that keep their SIS and LMS and add governed agents. **Charter and independent schools** that want a learning platform without a separate LMS contract. **Homeschool co-ops** with mixed-age classes and parent teachers. **CS and maker classes** using GitHub, Supabase and their own Workers.

Talk to us

We're piloting with demo districts across Clever, ClassLink, Google Classroom, Canvas and schools with no LMS. Try **educateos.io/demo** or email **hello@educateos.io**.
