Algebra I — Explain and solve two-step equations (SCHO-255)

Algebra I

10 points · Published assignment

Teacher-authorized presentation

Course 896141390025 · Coursework 896261051224 · Fetched 2026-10-28T04:53:23.461Z

Learning goal

solve two-step equations and justify equivalent operations

Course 896141390025 · Coursework 896261051224 · Fetched 2026-10-28T04:53:23.461Z

Worked example

3x + 5 = 20 gives 3x = 15, x = 5; check 3(5)+5=20.

Independent practice

solve 2x+7=15, 4x-3=9, and 5x+2=2x+14. Show each operation on both sides, check each solution by substitution, and explain why the equation remains balanced. Submit a worked solution in Classroom.

Course 896141390025 · Coursework 896261051224 · Fetched 2026-10-28T04:53:23.461Z

Success criteria

correct solutions 6 points, justified steps and checks 4 points

Discuss and explain

Why must an operation be applied to both sides? Compare two valid solution paths and check by substitution.
